4. Conclusions

# 1. Introduction

# Introduction

## 2. Simulation Model

# Model development

Frigate

25 Blocks

50 Sub-blocks

Input Data

- Excel interface for input data
- Connected with Extendsim

Simulation Model

- Developed in ExtendSim
- Easy integration with SAP

Results

- Results tables
- Gantt Charts

# Model development

- 5 sub-blocks typology

Main sub-blocks attributes		
Typology	# Web frames	# Beams
Weight	# Longitudinal girders	# Spare parts (webs)
# Straight panels	# Transverse girders	# Profiles (webs)
# Shell panels	# Double bottom girders	# Spare parts (panels)
# Longitudinal profiles	# Bulkheads	# Profiles (panels)

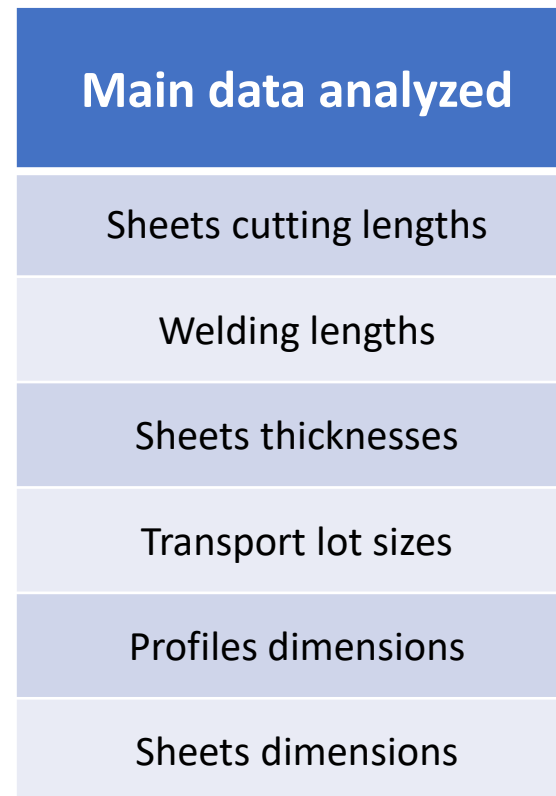

# Model development

- Input sequence

The screenshot shows an Excel spreadsheet with a table titled "Planificación". The table has four columns: "ID subbloque", "ID subbloque Navantia", "Día entrada corte", and "ID buque". The data is as follows:

ID subbloque	ID subbloque Navantia	Día entrada corte	ID buque
1	103a1	21,00	1
2	103b1	22,00	1
3	101a1	105,00	1
4	101b1	106,00	1
5	105a1	28,00	1
6	105b1	29,00	1
7	107a1	0,00	1
8	107b1	1,00	1
9	109a1	75,00	1
10	109b1	76,00	1
11	111a1	6,00	1
12	111b1	7,00	1
13	401a1	9,00	1
14	401b1	10,00	1
15	403a1	15,00	1
16	403b1	16,00	1
17	405a1	25,00	1
18	405b1	26,00	1
19	407a1	84,00	1
20	407b1	85,00	1
21	409a1	110,00	1
22	409b1	111,00	1
23	411a1	137,00	1
24	411b1	138,00	1
25	413a1	139,00	1
26	413b1	140,00	1
27	415a1	145,00	1
28	415b1	146,00	1
29	501a1	131,00	1
30	501b1	132,00	1

# Model development

**Procesos en Taller de Prearmiento 1**

**1 Prearmiento 1**

Primera fase de prearmiento en P1. Montaje en posición invertida subbloque

Tiempo transporte de subbloque de Prefabricación a Prearmiento 1 (h)	4
Tiempo montaje de un tubo (h)	7
Nº operarios (unidades)	6
Porcentaje del tiempo total de P1 que se corresponde con montaje de tubería	0,6
Porcentaje del tiempo de primera fase de prearmiento sobre el total de P1	0,8
Proporción del tiempo de P1/P2	0,8

**Atributos generales**

**Atributos**

Nº celdas Prefabricación	16
Nº celdas Prearmiento 1	6
Nº celdas Prearmiento 2	7
Nº cabinas Chorro y Pintura	3
Nº mafis	2
Nº grúas	1

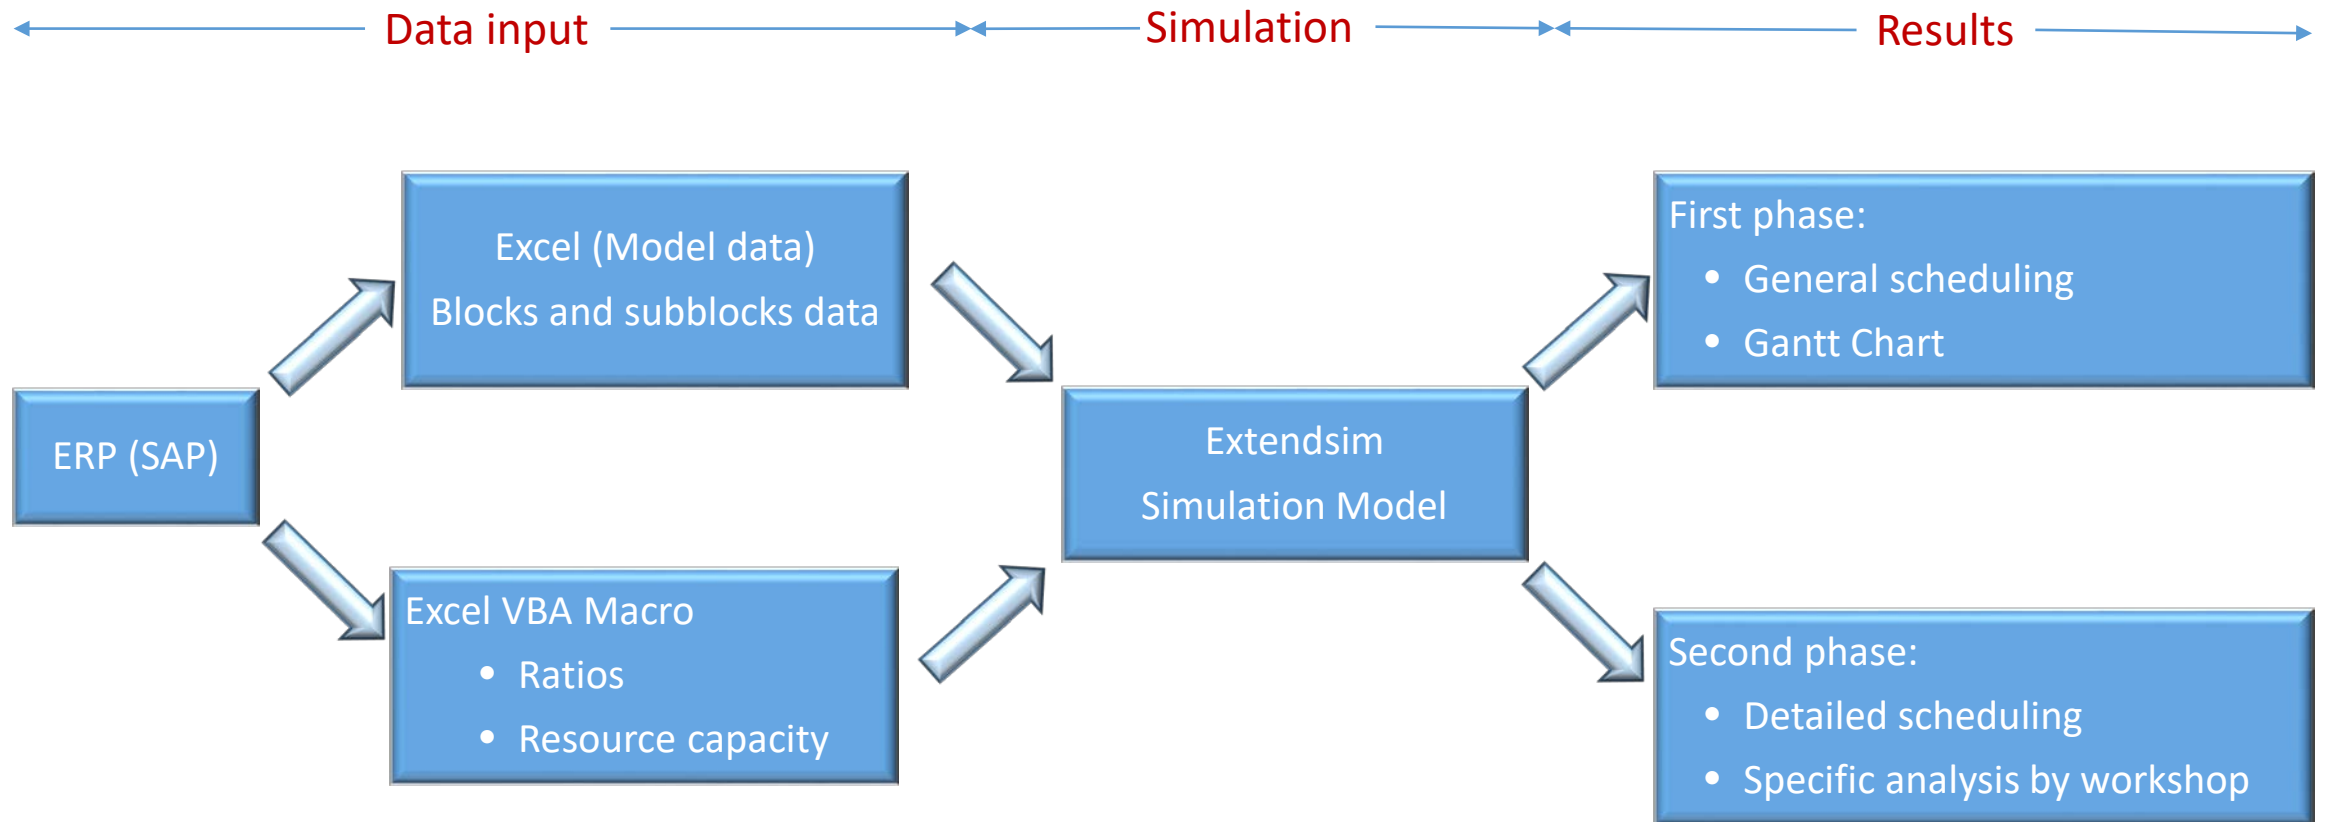

**Procesos en Taller de Prearmiento 1**

**1 Prearmiento 1**

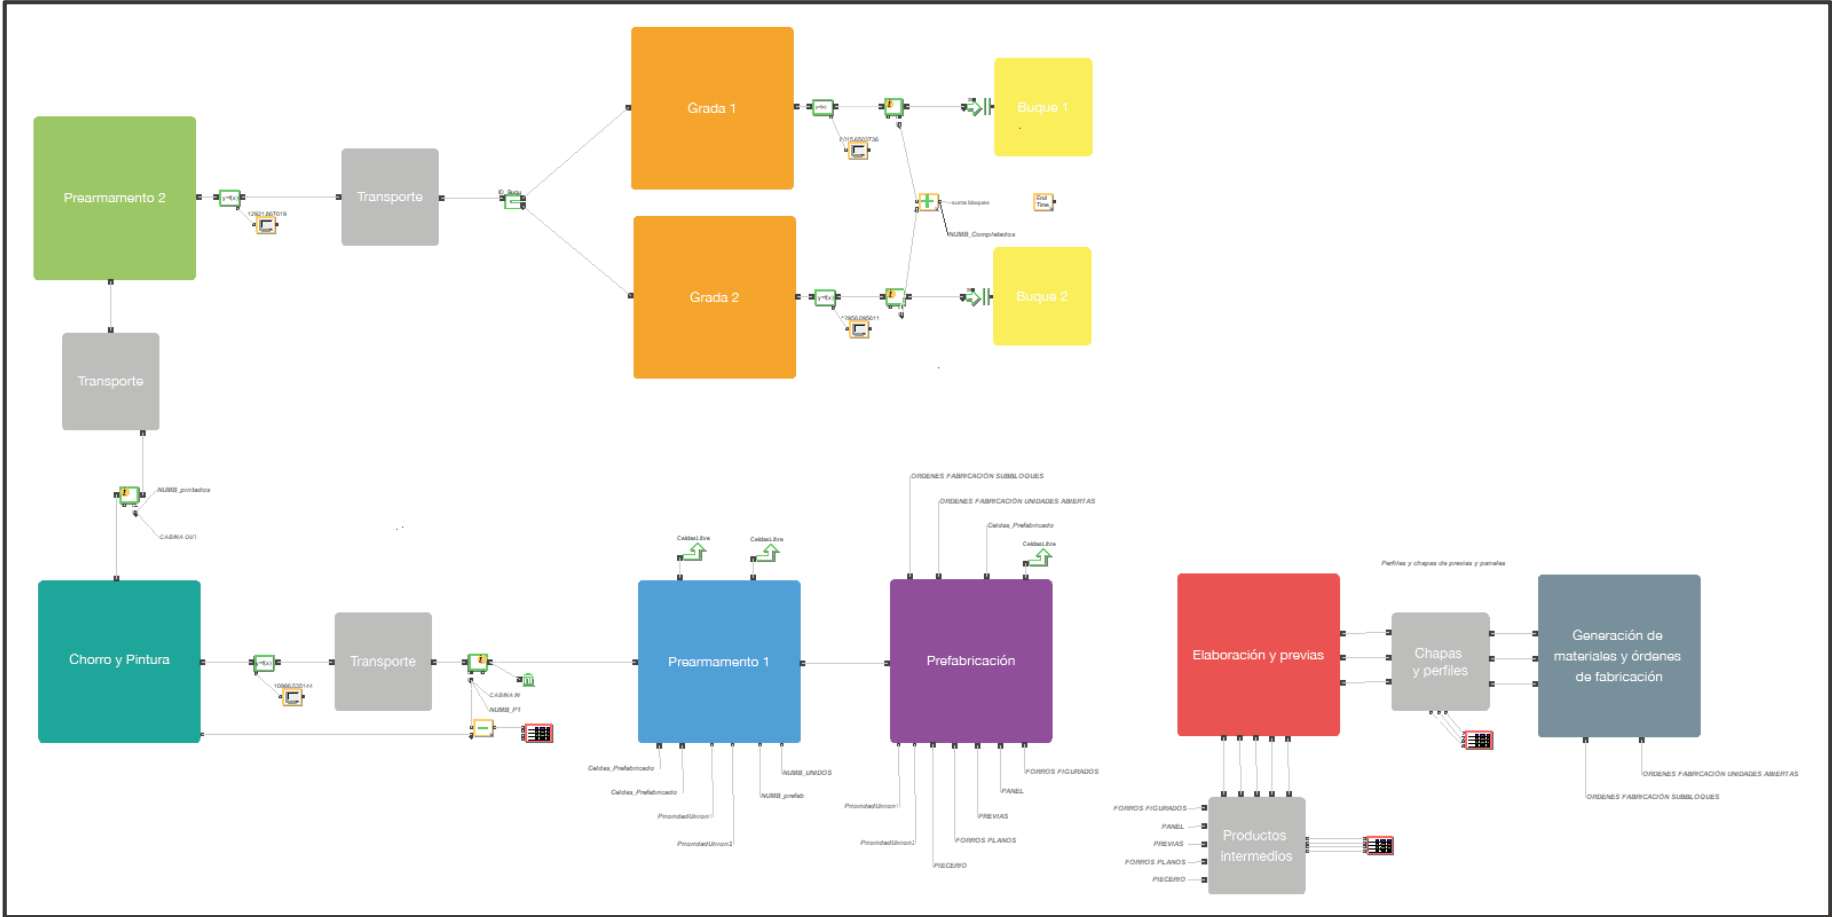

Tercera fase de Prearmiento en P1. Montaje del bloque en posición normal

Tiempo transporte de prefabricación del bloque a tercera fase de Prearmiento 1 (h)	4
Nº operarios montaje (unidades)	6
Tiempo montaje de un tubo (h)	7
Tiempo tercera fase de Prearmiento 1 sobre el total de P1 (%)	0,1
Proporción de tiempo P1/P2	0,8
Porcentaje del tiempo total de P1 que se corresponde con montaje de tubería	0,6
Tiempo transporte de bloque a Chorro y Pintura (h)	4

# Simulation process

# Model & Hierarchical blocks

## 4. Experimentation and Results

# Experimentation and results

## Exp. 1 – Improved production scheduling

- Aggregate planning at early stages of the project
- Objective: to find an improved production scheduling.
  - From first stage: first workshop
  - To last stage: arrival at the slipway
- Considerations:
  - Blocks assembly sequence in the slipway is fixed and predefined
  - Hard planning work
    - Big differences between blocks in dimensions, shape, structural conditions, etc.
    - Non linear process
    - Early stages of the project, when detailed technical data are unavailable

# Experimentation and results

## Exp. 1 – Improved production scheduling

### Real ship scheduling

- Long manufacturing times
- Unbalanced resources.
- Long waiting times.

### Improved ship scheduling

- 30% makespan reduction.
- Balanced resources.
- Buffers reduced

# Experimentation and results

## Exp. 1 – Improved production scheduling

Available bays in Subassembly workshop.

### Real ship sequence

- Less balanced utilization rate

### Improved ship sequence

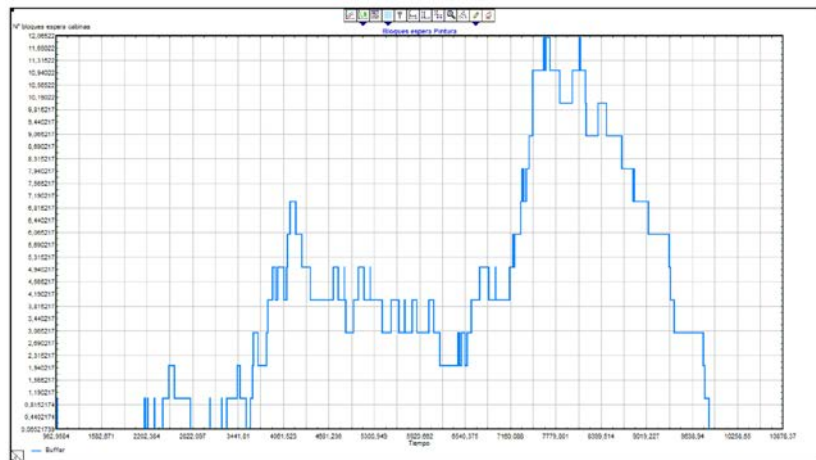

- More balanced utilization rate

# Experimentation and results

## Exp. 1 – Improved production scheduling

Buffer of blocks waiting for painting process

### Real ship sequence

- 12 blocks in buffer
- Long waiting times

### Improved ship sequence

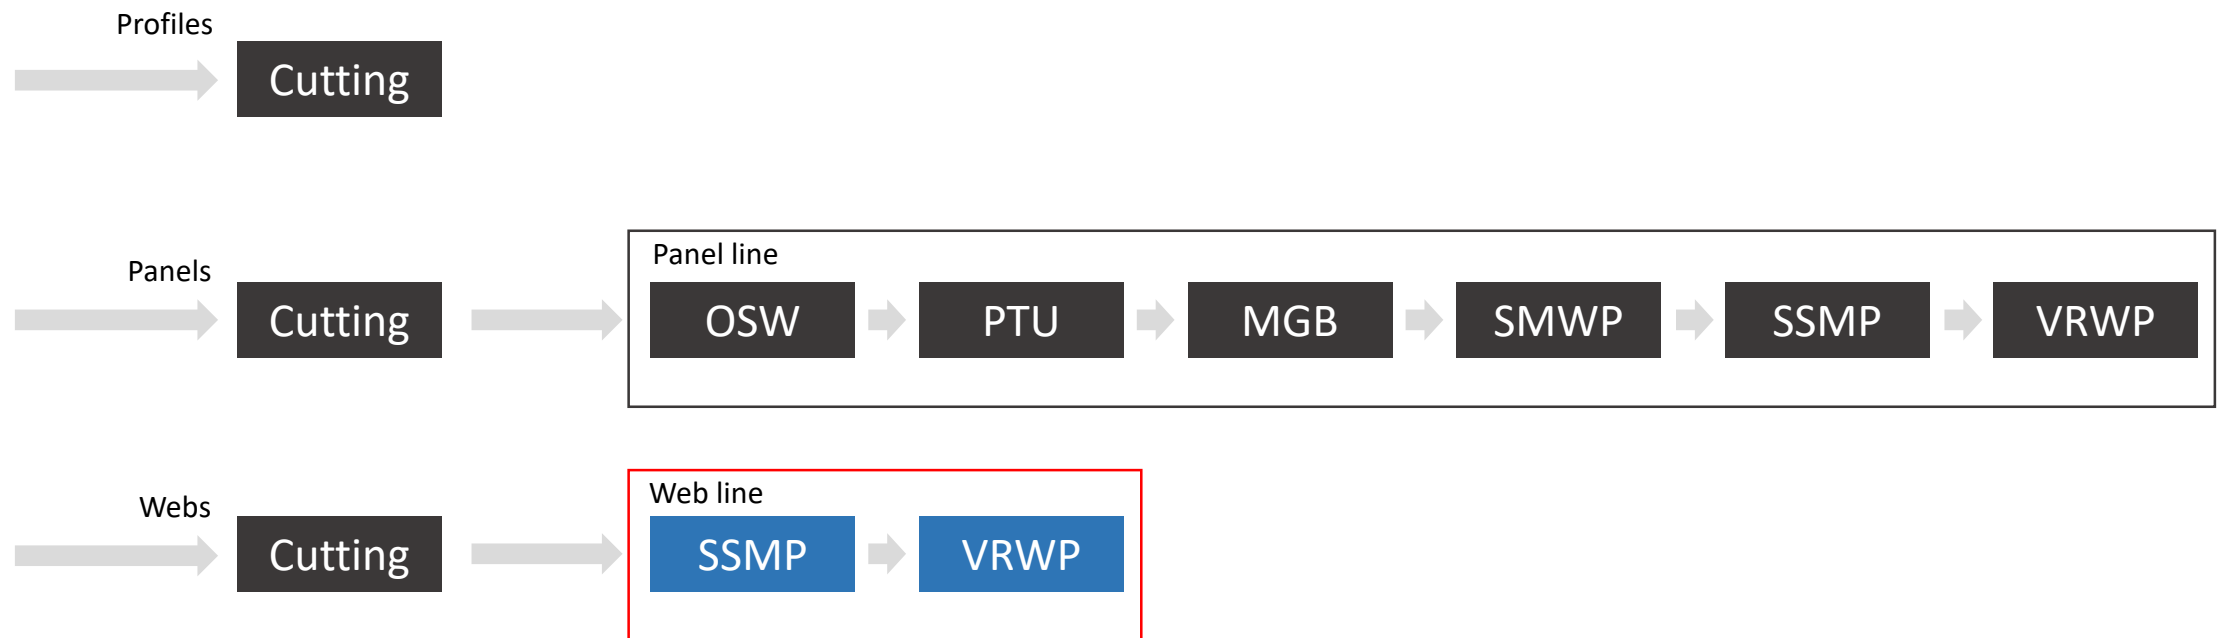

- 6 blocks in buffer
- Short waiting times

# Experimentation and results

## Exp. 2 – Analysis of the Cutting & Welding workshop

- Very important: 1<sup>st</sup> stage of the process
- All other stages need that all parts arrive as soon as possible

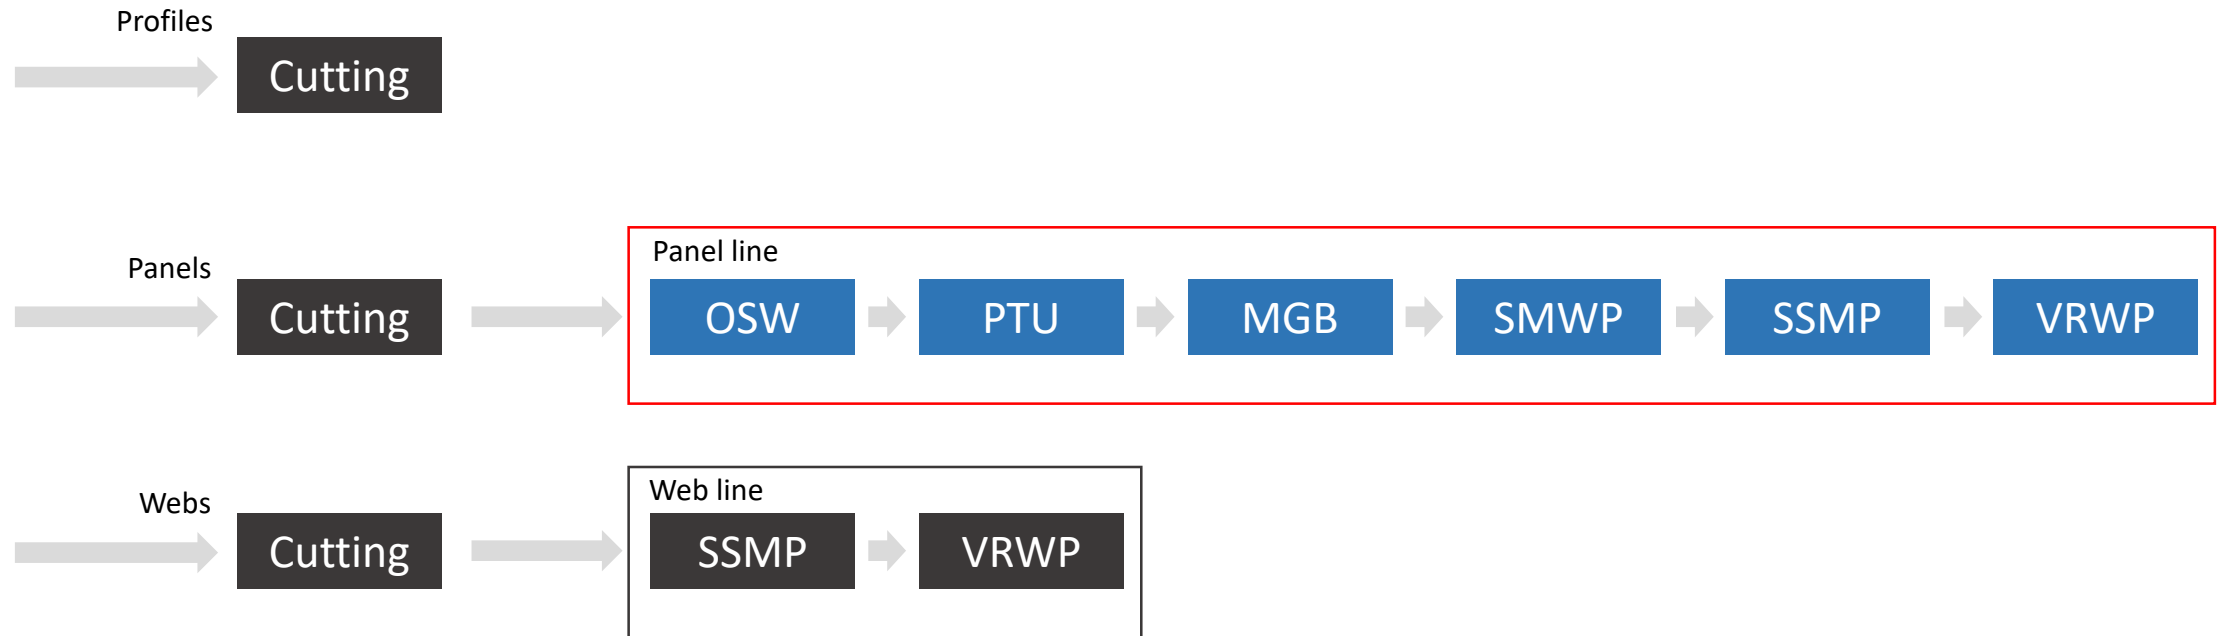

# Experimentation and results

## Exp. 2 – Analysis of the Cutting & Welding workshop

- **Level:** detailed.
- **Objective:** Analyze the workshop to detect the limiting resources and select the most appropriate actions to improve its utilization rate and thus reduce the workshop's makespan.
- **Results:**
  - The welding station (VRWP) of the web line is the bottleneck of the workshop.
  - Utilization rate mounting station (SSMP): 29%
  - Utilization rate welding station: 97.2%
- **Actions:**
  - Increase of the capacity of the welding station in the web line would increase the overall capacity of the workshop, reducing the makespan of this workshop by 50%.

# Experimentation and results

## Exp. 3 – Panel line: maximum capacity analysis

# Experimentation and results

## Exp. 3 – Panel line: maximum capacity analysis

- **Level:** detailed.
- **Objective:** Determine the maximum capacity of the panel line (Cutting & Welding workshop).
- **Experiment:**
  - The line is saturated, generating all part and components of 2 frigates at start time.
  - Different scenarios are generated, changing the number of Mounting and Welding stations and the shifts number.

# Experimentation and results

## Exp. 3 – Panel line: maximum capacity analysis

- **Results:** The best scenario is the one with 2 Mounting and 2 Welding stations.
  - # shifts: depend on the capacity needed to meet the milestones agreed with the client and the associated costs.

Shifts	Mounting stations	Welding stations	Maximum capacity (95% CI) (panels/week)	Maximum capacity (95% CI) (blocks/week)
1	1	1	2.598 ± 0.015	0.411 ± 0.002
	1	2	2.756 ± 0.014	0.436 ± 0.002
	2	2	4.646 ± 0.042	0.735 ± 0.007
	2	4	4.759 ± 0.042	0.753 ± 0.007
	2	1	3.686 ± 0.026	0.583 ± 0.004
2	1	1	5.138 ± 0.060	0.813 ± 0.010
	1	2	5.487 ± 0.044	0.868 ± 0.007
	2	2	9.340 ± 0.110	1.478 ± 0.017
	2	4	9.550 ± 0.066	1.511 ± 0.010
	2	1	7.365 ± 0.053	1.165 ± 0.008

## 5. Conclusions and Future Research

# Conclusions (a)

- A multilevel simulation model for a shipyard has been proposed and validated.
- Two level: aggregate (first stage of the project) and detailed (when project has started).
- Software used: Extendsim. Right now: is a **3D model using Flexsim.**
- 3 experiments
- **Experiment 1:** aggregate level. Useful at the beginning when little information is available. The modeled obtains an “improved scheduling” reducing the makespan by 30% with a balanced use of resources.

## Conclusions (b)

- **Experiments 2 and 3:** detailed level. Aiming at a detailed analysis of first workshop of the shipyard: the Cutting and Welding workshop.
- Experiment 2 allows to characterize the bottlenecks and how the capacity of this workshop affects the makespan.
- Experiment 3 allows to determine the maximum capacity of the panel line (Cutting & Welding workshop) and find the best alternative to fulfill the milestones of the client.
- The model will be implemented in the Navantia military shipyard (Ferrol, Spain).

## Conclusions (c)

- Probably: the first complete virtual shipyard with all its workshops.
- The model allows to check many scenarios and all “building strategies”.
- The model will be implemented in the Navantia military shipyard (Ferrol, Spain).
- Many results has already been implemented.
- This virtual shipyard is a competitive advantage of Navantia for doing business with its clients.

# Future Research

- Develop scheduling heuristics in order to get an “optimized” schedule that minimizes the total makespan.
- Get detailed 3D models of each of the workshops of the shipyard.
- Optimize the shipyard layout using simulation.
